

Operator

→ Combining two names from different cells using the & (ampersand) operator

Syntax :- = A1 & " " & B1

Eg

A1	B1	Formula	Result
Tyothi	Arun	= A1 & " " & B1	Tyothi Arun

Conversion of horizontal to vertical (String)

→ Transpose function can be used for conversion of string from horizontal to vertical

Eg horizontal data:

A1	B1	C1
Tyothi	Arun	Abhi

Formula :- = TRANSPOSE (A1:C1)

Result :- Tyothi
Arun

Abhi

Conversion of string from vertical to horizontal

→ Transpose function can be used for conversion of string from vertical to horizontal

Eg:- vertical data

A

Apple

banana

orange

Formula :- =TRANSPOSE (A1:A3)

Result

A	B	C
Apple	Banana	Orange

Copy a String using paste link method

→ paste link creates a connection to the original cell. If the original string changes, the linked cell updates automatically.

eg:- Suppose cell A1 contains
Data analyst

Steps

- (i) Select cell A1
- (ii) press $Ctrl + C$
- (iii) Select the destination cell, for example B1.
- (iv) go to home → paste → paste link or $Ctrl + Alt + V$
- (v) Excel creates a link to the original cell.

Result in B1:

Data analyst

Add a new column and print the result in the

second column.

→ Select the column 1 and copy it.
first cell, then press $Ctrl + Alt + V$, choose option
add, click ok.

The output will be displayed in the second

column.
Same procedure follows for multiplication, division,
subtraction

Eg:	Data	Add	Sub	div	mul
	16	50	36	5.75	1584
	54	82	2	1.666667	594
	28	40	-27	3.321429	980
	34	128	-30	2.676471	272
	55	91	19	1.218182	4620
	63	86	-2	0.920635	5040
	28	112	-23	2.357143	2716
	52	62	-14	0.461538	2132

multiplication of number with absolute reference

→ An absolute reference keeps a specific cell fixed.
It uses the \$ symbol.

= Select the cell address, click * then select the another cell address for multiplication and fixed it using F4 key, double press it.

Eg:-

A1	A2
16	32
54	108

Conversion of positive to negative

→ To convert positive to negative numbers, we use (-) operator.

Eg:- If $A1 = 100$
 $= A1 * -1$

Result = -100

Conversion of negative to positive

we neglect the (-) operator for the conversion.

Eg:- If $A1 = 100 \rightarrow = A1 * 1$ Result = 100

Calculation of total marks acquired in each subject.

→ For Column Calculation we manually use the Column cell addresses

eg:-

A names	B Sub1	C Sub2	D Sub3	Total
Tyothi	45	50	55	150 (=B2+C2+D2)

Calculate the tax for the salary (tax should be fixed)

→ Tax Calculation using absolute reference means multiplying each salary by a fixed tax rate using an absolute cell reference, which remains unchanged when the formula is copied to another cell

eg:-

A Names	B Salary	C tax amount	E tax
Tyothi	15,000	1200	(=B2*\$E\$1) 8%
Abun	22000	1760	(=B3*\$E\$1)
